## Commercial Copper Ionizers For Swimming Pools

Aqua Parks • Commercial and Domestic Swimming Pools up to 8000 cubic meters

Established in 2004, PISCINADIMARE.IT is a manufacturing company specializing in disinfection of water via electrolysis, copper and silver-copper ionizers and ozone, for swimming pools, drinking water, agriculture, fountains and ponds. With its primary focus on environment first, PISCINADIMARE.IT guarantees the highest Italian quality, innovation and value.

A pool water ionizer is a device that releases positively charged silver and copper ions into the pool water. These ions kill the microscopic organisms such as algae, bacteria and fungi in the water. The use of a water ionizer also improves the pool water filtration. There are several benefits to using a pool water ionizer.

### 1 – Better Filtration

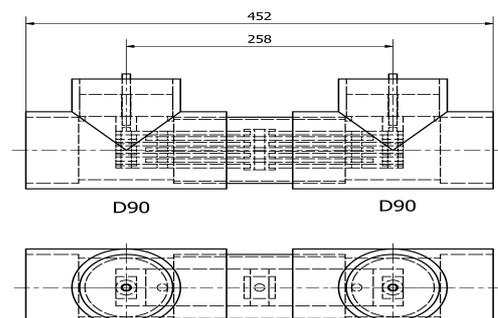

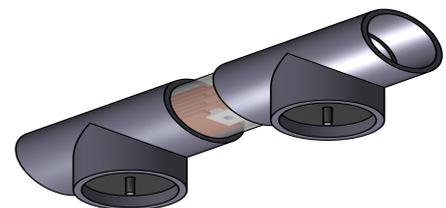

Most pools get dirty because of the presence of minuscule particles in the water. These particles are too tiny to be filtered out and remain in circulation in the pool water. The positive copper and silver ions emitted from the pool water ionizer bind with these particles, which are negatively charged. After the process of binding, the particles are large enough to be weeded out with the process of filtration.

### 2 – Kills Algae and Bacteria

The water pool ionizer emits a small current, which is highly effective in killing the micro-organisms in the pool water. This removes the presence of algae, bacteria, viruses and fungi in your pool, making it safer for you to enjoy.

### 3 – Minimizes Requirement for Chlorine

A pool water ionizer is effective in tackling algae and bacteria in most swimming pools. To improve sanitization, you may need to add small amounts of chlorine. You require minimal chlorine to be added to the pool, to improve the overall cleansing. In most cases, the chlorine required is so small in quantity that it cannot even be detected by swimmers.

La Soluzione Salina

Made in Italy

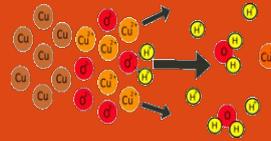

- No more chlorine dry skin
- Save you about 80% on your pool water expenditures and maintenance
- Increase the life on vinyl liners
- Have wetter water in your pool
- Eliminate storing of hazardous chemicals

An ionized pool is one of the greatest pleasures you will experience. Once you realize the beauty of swimming in an ionized pool, you will only have to swim in a chemically-treated pool one more time to know how bad chlorine is and how lucky you are to have an ionized pool.

Without a proper sanitation, then algae, viruses, fungi, and other micro-organisms can originate, grow, multiply, and infest the average pool in less than one hour. Diseases too numerous to mention affecting the ears, eyes, nose, throat, skin, and internal organs are often spread from one person to another.

Ionization was developed by NASA and is the least expensive of all disinfecting methods. Ionization is also the only method that produces healthy pool water. Ionization is the easiest of all disinfecting methods to maintain and monitor.
